Web journey analysis — Workflow overview (by theme, compact version, 3 columns)

MANUAL CAPTURE (prerequisite, human, outside the skill)

Network : Preserve log + Disable cache
Full journey, cookies accepted
-> 'Save all as HAR with content' (.har)

Coverage panel (Cmd+Shift+P)
Record, reload, scroll
-> export JSON per page (Coverage-*.json)

COLLECTION (automatic)

HAR, Coverage, Core Web Vitals
(analyze_har.py, coverage_metrics.py,
collect_cwv_pagespeed.py or run_lighthouse.sh as fallback)

AUTOMATIC EOF JUDGMENT (automatic)

run_eof.py compares the data
already collected against the EOF reference
(~10 criteria out of 54 settled by script,
the stays stays 'I don't know')

Legend

Pale grey background: automatic
(machine calculation, no human action)

Light blue background: human action required
(input, decision, or answer from an external third party)

Reference doc: capture-har-and-coverage.md
../../.claude/skills/analyse-parcours/docs/

CO2e IMPACT (optional, at any time)

/efootprint -> Boavizta model (reference
+ 3 scenarios cumulative prio1 / prio1+2 / prio1+2+3)
-> data available for the NEXT
generation of report, not an add-on final isolated

Possible human action: annual traffic and
size of instance cloud, if not auto-detected

REPORT — first generation (automatic)

generate_report_html.py
(+ check_report_values.py, check
internal not blocking)
-> contains already the judgment EOF automatic
(partial) and the CO2e if already calculated

EOF QUESTIONNAIRE (manual, decision of mission)

When: after the automatic judgment,
only on the remaining criteria
'I don't know' - never before,
never triggered on its own

generate_questionnaire.py -> file to fill in
(questionnaire-eof.md), sent to client,
filled in, read (parse_questionnaire.py),
merged (merge_lots.py) according to the
precedence collected > estimated > stated
> declared > assumed

REPORT — regeneration (automatic)

generate_report_html.py
-> reflects the answers of questionnaire
merged (+ CO2e if calculated meanwhile)
