Web journey analysis — Overview of the workflow (by theme)

Legend

Pale grey background: automatic
(machine calculation, no human action)

Light blue background: human action required
(input, decision, or answer from an external third party)

[ref] Reference doc: capture-har-and-coverage.md
../../.claude/skills/analyse-parcours/docs/

MANUAL CAPTURE [ref] (prerequisite, human, outside the skill)

Network : Preserve log + Disable cache
Full journey, cookies accepted
-> "Save all as HAR with content" (.har)

Coverage panel (Cmd+Shift+P)
Record, reload, scroll
-> export JSON per page (Coverage-*.json)

cwv.json (Core Web Vitals) optional: Lighthouse launches automatically if absent (collect_cwv_pagespeed.py), or provided by the user (RUM/PageSpeed).

COLLECTION (automatic)

HAR, Coverage, Core Web Vitals
(analyze_har.py, coverage_metrics.py,
collect_cwv_pagespeed.py or run_lighthouse.sh as fallback)

AUTOMATIC EOF JUDGMENT (automatic)

run_eof.py compares the already
collected data against the EOF reference
(~10 criteria out of 54 settled by script,
the rest stays "I don't know")

CO2e IMPACT (optional, at any time)

/efootprint -> Boavizta model (reference
+ 3 cumulative scenarios prio1 / prio1+2 / prio1+2+3)
-> data available for the NEXT
report generation, not an isolated final add-on

Possible human action: annual traffic and
cloud instance size, if not auto-detected

Can be launched before or after the first report, before or after the EOF questionnaire: each report generation simply picks up the data then available on disk.

REPORT — first generation (automatic)

generate_report_html.py
(+ check_report_values.py, internal
non-blocking check)
-> already contains the automatic EOF judgment
(partial) and the CO2e if already calculated

EOF QUESTIONNAIRE (manual, mission decision)

When: after the automatic judgment,
only on the criteria left
"I don't know" - never before,
never triggered on its own

generate_questionnaire.py -> file to fill in
(questionnaire-eof.md), sent to the client,
filled in, read back (parse_questionnaire.py),
merged (merge_lots.py) according to the
precedence collected > estimated > stated
> declared > assumed

Trap to avoid: never rerun run_eof.py alone after a questionnaire read-back (it silently overwrites the answers). Always parse_questionnaire.py -> merge_lots.py -> generate_report_html.py.

REPORT — regeneration (automatic)

generate_report_html.py
-> reflects the questionnaire answers
merged (+ CO2e if calculated meanwhile)
